Description

The MDM6000 High Speed Satellite IP Modem is a versatile next generation modem optimized for a wide range of applications such as cellular backhauling, IP trunking and fiber restoration. The MDM6000 modem is typically installed at both ends of a point-to-point satellite link or at the remote sites of a star network. The MDM6000 High Speed is identical to the regular MDM6000 with the addition of an external packet processor that handles encapsulation, decapsulation, shaping and QoS to achieve even higher pps performance than those offered by the regular MDM6000. Up to 800 kpps can be handled by a single modem. The modem is in full compliance with the DVB-S2 and DVB-S2X standards, achieving the highest possible efficiency at maximum service availability.

The MDM6000 High Speed Satellite Modem is a versatile modem which allows service providers and government operations to increase the amount of services or the customer base within the same bandwidth. At the same time it introduces ways to reduce OPEX costs and increase the profitability of their business at maximum efficiency and optimum availability.
Efficiency at the Core

The Newtec MDM6000 High Speed Satellite Modem combines a number of innovative elements to improve current market available efficiencies, thereby lowering the overall Total Cost of Ownership.

New modulation and Forward Error Correction (FEC) codes up to 256APSK in the DVB-S2X standard in combination with innovative technologies such as 133 MBaud, Clean Channel Technology®, Bandwidth Cancellation (BWC), Automatic Uplink Power Control (AUPC), FlexACM®, QoS, Shaping and Equalink® 3 are embedded in the modem and bring the satellite link to full efficiency.

Depending on the application, the Newtec MDM6000 High Speed Satellite Modem can be used in conjunction with the Newtec HUB6000 Satellite Hub. The performance can be increased even more by adding Newtec’s network optimization technologies, such as acceleration, compression and bandwidth management.

Optimal Availability

Newtec’s auto-adaptive technology FlexACM is incorporated in the MDM6000 modem and deals with fading conditions (rain, dust, interference) and inclined orbit satellites. Thanks to FlexACM, fading will no longer interrupt the transmission between the hub and remote sites nor result in loss of data. The maximum possible throughput can be achieved at all times. Additionally, the Automatic Uplink Power Control mechanism ensures maximum use of the link budget at all times.

Flexibility and Scalability Matching Market’s Business Models

The MDM6000 Satellite Modem provides a scalable and flexible platform which allows customers to grow their business depending on their application and investment plan. The modem comes with all features that can be unlocked by means of a very granular licensing scheme depending on the needs as the business grows.

All modulation modes and maximum symbolrate are always available, the capability of the modem is determined by its IP throughput license with rates as low as 20 Mbps up to 425 Mbps in very granular steps. This makes the MDM6000 suitable for either medium to high speed links requiring a high number of pps.

The built-in bandwidth canceller completely operates in the digital domain providing unsurpassed performance with the lowest possible residual cancellation noise resulting in the highest spectral efficiency. Non-linear post compensation (NLPC) performs real-time analysis of the complete received spectrum and reduces intermodulation interference that affects the demodulated carrier. Fractional licensing of the bandwidth cancellation option allows for cost-effective redundant setups.

A built-in spectrum analyzer and constellation diagram viewer facilitate debugging and monitoring.

The MDM6000 High Speed Satellite Modem can be easily monitored and controlled via a comprehensive front panel menu, CLI, advanced web GUI and via SNMP protocol. This enables easy integration into any industry-standard EMS/NMS system.
